Pattern Problem

Create a program that prints a pattern of alternating '**+**' and '*****' characters. Given a fixed value called height (**e.g., height = 5**), the top row should print exactly height characters, and each subsequent row should print one fewer character, resulting in a total of height rows, with the characters alternating between '**+**' and '*****' each row. If the input height is negative, the program should convert it to a positive value, and if the input height is 0, the program should display "**Error**" message indicating that the height is invalid.

Example Output:

height = 5

```
+++++
****
+++
**
+
```

height = -6

```
++++++
*****
++++
***
++
*
```

height = 0

```
Error
```
